

Gen AI Use - Asli Gulcur

Phase 1

Brainstorming and idea exploration:

Before my final pick, I explored around 8 alternative ideas in detail with **Claude Opus 4.6**, **ChatGPT 5.4** and **Gemini Pro 1.5**. I refined each idea thoroughly and then discarded them as I was not convinced or excited. Each exchange with the model on an idea was very long with exploration, ranking, stress-testing – e.g. heavy iteration loop with me questioning why, why, why...

Understanding the execution process:

Once I picked the idea, I then used **Gemini Pro 1.5** and **Fast** as an educational tool for execution purposes. “How should I start building this from scratch as a solo developer in 3-4 weeks with my constraints (no agent building experience)?”

I asked for the execution process steps (building), system diagram and clarification on the components I should use (Open Claw, Claude, Cursor etc...).

What I used it for	Prompt	My intervention
Architecture Research & Refinement	"Help me design a multi-agent procurement simulation safely and successfully given my constraints."	I landed on the Hub-and-Spoke model to ensure absolute vendor isolation after prompting about vendor data isolation/leakage etc...
Persona Engineering	"Develop the agent personas for buyer and bidders"	I steered the LLM to include a “malicious” buyer as well. I wanted an adversarial agent in addition to rational ones.

Guardrail Design	"How can I ensure safety and prevent unauthorized spending if I use the OpenClaw framework for procurement?"	Steered the design for deterministic guardrails e.g. budget check.
Draft Report	"Based on our exchanges, draft the Phase 1 report inline with the requirements."	Iterated several times after the initial draft.
